

Transit specific Issues

Appreciating existing technologies in place are typically rigid and hard wired, our latest offering we feel changes the ball game when combatting offenders in real time in remote locations.

Whether the targets are rail corridors, rail sidings, bridges, substations or other such targets, our portable micro thermal range is second to none. With potential detection range of 200 metres or the portable micro option to form a detection barrier around an asset or location the thermal units can do their work readily.

Bringing the ability for full view in complete darkness 150 metres before offenders reach their target allows unprecedented ability to engage with offenders in real time using local Police or transit law enforcement.

Our micro triggers detect their target and send a signal to the camera to wake, take live images or video and send them direct to 3 operators. Whether we provide the service, or it sends live to control rooms or your law enforcement, its about getting to the offenders in real time, can in hand.

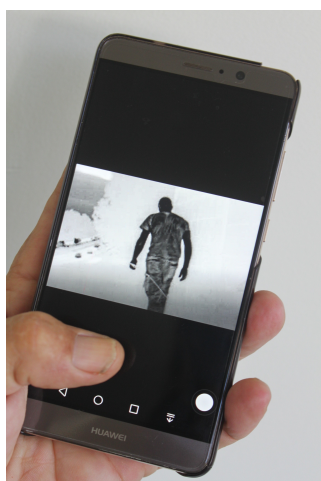

All of our equipment is portable, low power and subterranean, meaning they are readily deployed and left to do their work before requiring a recharge. The ability to be able to see in complete darkness as a much wanted offender enters the rail corridor at midnight in real time excites many realising the huge impact this ability brings in cutting offenders and costs.

Knowing your top 30 offenders are likely worth tens of thousands of dollars in damages each, users are quick to recognise what our technology brings in new options and abilities for your enforcement.

Our work with multiple local law enforcement agencies and their respective Cities recognises a mutual benefit in stopping shared offenders. Local Police are often more than happy to assist in apprehending offenders at the local rail substation when they realise they are the Cities worst vandal also.

Whether your Network is focussed on increasing results at its rail sidings, rail corridors or other assets, we feel we can bring to the table the opportunities that are cost effective and results driven.

For a no obligation discussion or additional information, be sure to reach out to us and recognise how inexpensive and cost effective our range is that delivers these potential results.

3.00am is like broad daylight to the 3G long-range micro thermal
